

INFS605 Assignment 2 – Student Help File

Functional Completeness (10%)

- Aim for 3+ working services, each with at least 2 RESTful endpoints.
- Test all endpoints using Postman or CURL before submission.
- Provide example testing responses in your README or a separate document.

Microservices Architecture & Separation (15%)

- Each service should have its own folder, codebase, and Dockerfile.
- Ensure each service is responsible for only one piece of functionality.
- Use HTTP communication or message queues only when needed.
- Avoid duplicating DB connections or shared logic.

Dockerization and Deployment (5%)

- Again, each service must have a working Dockerfile.
- Define all services in docker-compose.yml.
- Use .env.example to show how configuration is passed.
- Include screenshots of all services running on your computer using docker compose up.

Documentation (5%)

- README.md must include setup steps, endpoint examples, and service descriptions.
- Include an architecture diagram (PNG or ASCII).
- Add screenshots or a short screen-recording of the system in action.

Code Quality and Modularity (5%)

- Organize code using functions, classes, or route files as needed.
- Use best practices for documenting your code
- Use a tool like Prettier, *Lint or similar, to enforce a consistent code style
- Use one language per service where possible.
- Include docstrings or comments to explain your logic.
- Add simple validation or error handling if possible.
